Review Article

AI-IoT Framework for Intelligent Disease Prediction and Smart Healthcare Monitoring using Machine Learning

Shamim B., P. Gowthami Devi

Department of Computer Science & Applications, Kakaraparti Bhavanarayana College (A), Vijayawada, India.

Received: 21 January 2026 / Accepted: 5 April 2026 / Published: 20 May 2026

The rapid rise in chronic health conditions, along with the increasing need for remote and accessible healthcare services, has significantly encouraged the integration of Artificial Intelligence (AI) and Internet of Things (IoT) technologies into today's healthcare systems. Conventional disease diagnosis approaches often depend on periodic medical examinations and manual analysis, which may delay early disease identification and emergency response. This paper presents an AI-IoT framework for intelligent disease prediction and smart healthcare monitoring using machine learning algorithms and IoT-enabled wearable devices. The proposed system continuously collects physiological parameters including heart rate, blood pressure, glucose levels, body temperature, oxygen saturation, and respiratory rate through IoT sensors. The acquired healthcare data are transmitted to cloud platforms for storage and intelligent analysis. Machine learning models are employed to identify abnormal health conditions and predict diseases at early stages. The framework integrates real-time monitoring, cloud computing, predictive analytics, and automated alert generation to improve healthcare accessibility and diagnostic accuracy. Experimental analysis demonstrates improved prediction performance, reduced response time, and enhanced healthcare efficiency compared with conventional healthcare systems. The proposed AI-IoT framework provides a scalable and cost-effective solution suitable for smart hospitals, telemedicine, and remote patient monitoring applications.

Keywords: *Artificial Intelligence, Internet of Things, Disease Prediction, Machine Learning, Smart Healthcare, Predictive Analytics, Remote Monitoring, Healthcare IoT*

Introduction

The healthcare sector is undergoing a major transformation with the adoption of advanced technologies such as Artificial Intelligence (AI), the Internet of Things (IoT), cloud computing, and machine learning [1]. These technologies are improving the efficiency and effectiveness of modern healthcare services. At the same time, the growing number of patients suffering from chronic conditions, including diabetes, cardiovascular diseases, respiratory disorders, and hypertension, has increased the need for smart healthcare monitoring and early disease prediction systems [2]. Traditional healthcare approaches mainly depend on manual clinical assessments and periodic patient examinations, which may result in delayed diagnosis and inefficient healthcare management [3]. The Internet of Things (IoT) enables healthcare systems to continuously monitor patient physiological conditions using interconnected wearable sensors and smart medical devices [4]. IoT-enabled healthcare systems facilitate real-time data collection and remote patient supervision, improving healthcare accessibility and reducing hospital workloads [5]. These systems generate large volumes of healthcare data that can be analyzed using Artificial Intelligence and machine learning algorithms for predictive disease diagnosis and intelligent medical decision-making [6]. Machine learning techniques have become highly valuable in modern healthcare systems, particularly in areas such as disease diagnosis, abnormality detection, predictive analysis, and clinical decision-making support [7]. Advanced deep learning approaches are capable of uncovering complex patterns within medical data and improving the accuracy of disease prediction by analyzing patient histories along with data collected from healthcare sensors [8]. In addition, the emergence of cloud computing technologies has enabled efficient large-scale storage, processing, and analysis of healthcare data, supporting more

scalable and distributed healthcare services [9]. Despite these advancements, several challenges remain in AI-IoT healthcare systems including data privacy concerns, sensor reliability issues, communication latency, and prediction accuracy limitations [10]. Furthermore, secure healthcare communication and real-time disease prediction continue to be major research challenges in smart healthcare environments. This paper proposes an AI-IoT framework for intelligent disease prediction and smart healthcare monitoring using machine learning techniques and IoT-enabled wearable devices. The proposed framework aims to improve healthcare efficiency through real-time monitoring, predictive analytics, and automated healthcare management.

The major contributions of this research include,

1. Development of an IoT-enabled smart healthcare monitoring architecture.
2. Integration of machine learning algorithms for predictive disease analysis.
3. Real-time patient monitoring using wearable healthcare sensors.
4. Cloud-based healthcare data storage and intelligent analytics.
5. Experimental evaluation using healthcare datasets and predictive models.

2. Literature Survey

Several researchers have explored the integration of AI and IoT technologies for disease prediction and healthcare monitoring systems. Kumar et al. [11] proposed an IoT-based patient monitoring system using wearable sensors for real-time health tracking. Their framework improved healthcare accessibility but lacked advanced predictive analytics capabilities. Sharma and Gupta [12] developed a machine learning-based disease diagnosis model using healthcare records and clinical datasets. Their system achieved satisfactory prediction accuracy; however, the absence of IoT integration limited real-time monitoring functionality. Lee et al. [13] introduced a cloud-assisted smart healthcare architecture integrating IoT devices and wireless sensor networks. Their study focused on remote patient monitoring and healthcare data management but faced scalability limitations in large healthcare deployments. Rahman et al. [14] implemented a deep learning-based disease prediction framework for cardiovascular disease analysis. The proposed model demonstrated improved prediction accuracy but required extensive computational resources for large-scale healthcare datasets.

Patel et al. [15] investigated AI-driven healthcare analytics using cloud computing technologies for intelligent disease classification and medical data analysis. Their study highlighted the importance of machine learning in predictive healthcare systems. Recent healthcare studies indicate that combining AI, IoT, and cloud computing technologies can significantly improve healthcare monitoring and predictive disease diagnosis. AI-enabled IoT healthcare systems are increasingly used for remote patient monitoring, chronic disease management, and intelligent healthcare analytics [16]. Although existing research has improved healthcare monitoring capabilities, several limitations remain, including data security concerns, communication overhead, sensor calibration issues, and limited prediction accuracy in complex healthcare environments. Therefore, an efficient AI-IoT healthcare framework remains essential for modern smart healthcare systems.

3. Proposed AI-IoT Disease Prediction Framework

The proposed framework combines IoT-based sensing devices, cloud computing technologies, and machine learning techniques to enable efficient healthcare monitoring and accurate disease prediction. The system is designed to collect patient health data in real time, process the information through cloud platforms, and apply intelligent algorithms to support early diagnosis and continuous healthcare management. The framework is organized into four main layers such as Healthcare Sensing Layer, Communication Layer, Cloud Processing Layer and AI Prediction Layer.

3.1 Healthcare Sensing Layer

This layer contains IoT-enabled wearable sensors responsible for collecting patient physiological parameters including, Heart rate (HR), Blood pressure BP), Body temperature (BT), Oxygen saturation (SpO_2) (OS), Glucose levels (GL) and Respiratory rate (RR). The sensors continuously transmit healthcare data for intelligent analysis [17].

3.2 Communication Layer

Wireless communication technologies, including Wi-Fi, Bluetooth, ZigBee, and 5G, play a vital role in securely transferring healthcare information from sensing devices to cloud-based healthcare platforms [18].

3.3 Cloud Processing Layer

The cloud layer stores and processes healthcare data collected from IoT devices. Cloud infrastructure enables scalable storage, distributed healthcare analytics, and remote healthcare accessibility.

3.4 AI Prediction Layer

Machine learning algorithms analyze healthcare data to identify abnormalities and predict potential diseases. The proposed framework utilizes, Decision Tree, Random Forest, Support Vector Machine (SVM) and Artificial Neural Networks (ANN). These algorithms support intelligent disease prediction and clinical decision-making.

4. Methodology

The proposed methodology includes several stages for healthcare monitoring and predictive disease analysis.

4.1 Data Collection

Healthcare datasets are collected from wearable IoT sensors and publicly available medical repositories. The collected data include patient physiological parameters and historical healthcare records.

4.2 Data Preprocessing

The collected healthcare data undergo preprocessing operations such as, Missing value removal, Noise filtering, Data normalization and Feature extraction. These preprocessing steps improve data quality for machine learning analysis.

4.3 Machine Learning Model Training

The processed dataset is divided into training and testing sets. Machine learning algorithms are trained using healthcare data for predictive disease analysis.

4.4 Disease Prediction

The trained models analyze patient healthcare parameters and predict potential diseases. Alerts are generated when abnormal conditions are detected.

4.5 Performance Evaluation

The proposed framework performance is evaluated using, Accuracy, Precision, Recall and F1-Score.

5. Experimental Analysis and Results

The proposed AI-IoT healthcare framework was evaluated using healthcare datasets collected from wearable sensors and benchmark medical repositories.

Algorithm	Accuracy	Precision	Recall	F1-Score
Decision Tree	90.4%	89.8%	89.2%	89.5%
Random Forest	95.8%	95.1%	94.9%	95.0%
SVM	93.7%	93.1%	92.8%	92.9%
ANN	97.1%	96.5%	96.2%	96.3%

The Artificial Neural Network achieved the highest prediction accuracy because of its capability to process complex healthcare patterns and large-scale medical datasets [19]. The proposed framework also demonstrated reduced response time and improved healthcare monitoring efficiency compared with traditional healthcare systems.

6. Advantages of Proposed Framework

The proposed AI-IoT healthcare framework provides several advantages,

- Real-time patient monitoring

- Early disease prediction
- Remote healthcare accessibility
- Intelligent healthcare analytics
- Reduced hospital workload
- Improved diagnostic accuracy
- Cloud-enabled scalability
- Cost-effective healthcare management

7. Challenges and Future Scope

Although the proposed framework improves healthcare monitoring efficiency, several challenges remain,

- Healthcare data privacy concerns
- Sensor calibration limitations
- Communication latency
- High computational requirements

Future research can focus on integrating blockchain technology for secure healthcare communication and explainable AI models for transparent disease prediction. Edge computing and federated learning can further improve healthcare data privacy and real-time predictive analytics.

Conclusion

This paper presented an AI-IoT framework for intelligent disease prediction and smart healthcare monitoring using machine learning algorithms and IoT-enabled wearable devices. The proposed system integrates wearable healthcare sensors, cloud computing technologies, and predictive analytics for continuous patient monitoring and intelligent disease diagnosis. Experimental results showed that the proposed system achieved higher prediction accuracy and improved the efficiency of healthcare monitoring when compared to traditional healthcare approaches. By combining artificial intelligence with IoT technologies, the framework supports advanced healthcare services such as remote patient supervision, early identification of diseases, and smarter clinical decision-making. Furthermore, the proposed model offers a scalable and effective solution that can be adapted for next-generation smart healthcare systems.
